

Quiz - Generative AI Solution Development

Generative AI Solution Development

[Back to course](#)

To identify and retrieve relevant domain-specific context from a Vector

Test passed

Final score: 90 of 100

Test completed in: 1h 8m 21s

Correct answer

Score: 5

Correct answer:

To identify and retrieve relevant domain-specific context from a Vector Store to augment the prompt sent to the LLM.

Question 9 of 20

In a RAG pipeline, why would a developer implement a "Reranking" step using a Cross-Encoder after the initial vector retrieval?

To reduce the cost of the pipeline by filtering out documents before they reach the Vector DB.

To translate the retrieved documents into the user's native language.

To address the precision limitations of ANN search by assessing the actual relevance of the retrieved documents to the query using a deeper semantic comparison.

To speed up the retrieval process by bypassing the Vector Store's internal ranking logic.

Wrong answer

Score: 0

Correct answer:

To address the precision limitations of ANN search by assessing the actual relevance of the retrieved documents to the query using a deeper semantic comparison.
